10. Technology Stack 63

1. Project Scope and Exclusions

1.1 In-scope Solution

- Responsive public hospitality website for hotel discovery, direct bookings, enquiries, offers, destinations, restaurants, Wess Cares, business expansion, careers, shop, facilities and legal pages, aligned to Figma.
- Role-protected administration portal for organisation/property configuration, content, reservations, promotions, payments, operational review, reporting, users and audit records.
- Channel manager for OTA connectivity, mapping, inventory/rate/restriction distribution, reservation intake, reconciliation, retry handling, automation rules and monitoring.
- Integration with the client-approved OPERA PMS interface for permitted data synchronisation and reservation write-back, subject to OPERA access, interface licensing, credentials and vendor documentation.
- Integration-ready payment workflow using a client-selected payment gateway; the gateway remains responsible for card capture and payment authorisation. Hotel bookings and shop orders remain separately correlated business flows.

1.2 Explicit Exclusions and Boundaries

- Not included Native mobile application development, app-store delivery and mobile-app-specific notification/account features. The responsive website is in scope.
- Replacement of OPERA, direct database access to OPERA, or modification of OPERA master records by the website or channel manager.
- Housekeeping, check-in/check-out, billing ledger posting, staff scheduling and other PMS operational functions remain in OPERA unless separately approved through an OPERA-supported interface.
- Any OTA connector not approved in the delivery backlog, any OTA subscription/certification charge, and channel certification work outside vendor-provided test environments.

- Payment processor merchant onboarding, chargeback handling and PCI certification beyond the use of hosted/tokenised payment controls supplied by the selected gateway.
- Hotel photography, translated editorial content, legal wording, tax-policy decisions and commercial pricing decisions; these are client inputs.

1.3 Planning Assumptions

OPERA interface

The hotel provides a supported, licensed integration route (such as an approved OPERA API/web service/interface) and non-production credentials before integration build begins.

Inventory authority

Room inventory, availability, base rates, room types, rate plans, policies, taxes and guest master records are maintained in OPERA.

Booking route

Direct website booking requests are orchestrated through the booking engine/channel manager and confirmed only after OPERA acknowledgement.

Change requests

Guest-requested changes/cancellations to an existing OPERA reservation are submitted as a request for reservations-team action unless an approved OPERA change API workflow is specifically contracted.

Time/currency

Each property has a configured local time zone and operating currency. Cross-property displays must label prices and time zones clearly.

2. Users, Roles and Operating Model

User / Role	Primary Access	Capabilities
Public Guest	Website	Search properties, review content, initiate booking/enquiry and use support routes.
Registered User	Website	View booking details and make supported booking-service requests.
Reservation Manager	Admin portal / OPERA	Review reservation requests, exceptions and changes; complete operational updates in OPERA.
Property Manager	Admin portal	Review property performance, inventory/rate status, channel health and operational exceptions.
Revenue Manager	Admin portal / OPERA	Maintain approved pricing strategy in OPERA and approve channel-specific rules/allocations.
Content / Marketing Editor	Admin portal	Manage approved CMS content, offers, pages, destinations, facilities and campaigns.
Channel Manager Operator	Channel Manager Admin portal	Configure channels/mappings, observe sync health, resolve exceptions and manage retry queues.
Super Administrator	Admin portal	Manage organisations, properties, users, roles, settings and audit oversight.

2.1 Operating Model

- Hotel operational truth remains in OPERA. The digital platform may display synchronised records but must show an appropriate error or last-known status when live data is unavailable.
- The channel manager is an orchestration layer: it maps, validates, distributes, receives and logs permitted commercial/reservation messages. It is not the PMS.

- Reservations staff retain responsibility for manual review of booking modifications/cancellations, conflicts, guest service recovery and operational actions that cannot be safely automated.
- Every administrative change and every external message must be attributable to a user, service account or system job with timestamp, correlation ID and outcome.

3. Architecture, Data Ownership and Integration Flows

3.1 Logical Solution Components

Component	Responsibility	Data Boundary
Public Website	Brand content, hotel discovery, booking entry, enquiries and payment hand-off.	Reads approved website content and booking availability; does not own PMS master data.
Booking Engine	Validate booking intent, payment state and reservation request; show status to the user.	Sends valid reservation payloads to the channel manager; awaits OPERA-originated confirmation.
Shop Commerce Service	Manage product catalogue, basket, product-order payment and fulfilment status for the Shop route.	Separate from OPERA room inventory and reservations; final provider/merchant model requires confirmation.
Channel Manager	Connect, map, validate, distribute and reconcile OTA/direct-channel data.	Receives OPERA sellable data and writes permitted reservation data back to OPERA.
OPERA PMS	PMS system of record for core hotel operations and confirmed reservations.	Owns core hotel, inventory, rate, guest, reservation, billing and operational data.
OTA / Metasearch / Agent Channels	External sales channels for availability, rates and reservations.	Receive approved distribution updates and send reservation events through approved APIs.

3.2 Authoritative Data Ownership

Data Domain	System of Record	Permitted Platform Action
Room types, Room inventory and Attributes	OPERA	Display synchronised sellable data; map identifiers; no master-data mutation.

Base rates, Rate plans, Meal plans, Taxes, Fees and Policies	Admin / OPERA	Display and distribute approved records; apply channel offers without changing OPERA base data.
Availability and Restrictions	OPERA	Receive/publish updates; distribute by channel/category; monitor delivery result.
Confirmed Reservations	Channel Partner / OPERA	Create reservation request through approved write-back; store external reference/status; never silently overwrite OPERA reservation.
Guest Profile / History	Admin / OPERA	Send only permitted booking guest/contact fields; do not maintain a conflicting guest master.
Website Editorial Content and Enquiries	Website / Admin	Create/manage in CMS; share only where an approved interface requires it.
Channel Mappings, Sync logs, Retry state and Rules	Channel Manager	Create/manage in channel manager; retain audit history.

3.3 End-to-end Direct Booking Flow

- Guest searches a property, dates, occupancy and room/rate criteria on the website.
- Booking engine requests current eligible availability/rates from the approved availability service, which is fed from OPERA through the channel manager/integration layer.
- Guest selects a room and rate, supplies contact/guest details and accepts booking/cancellation terms.
- The selected payment gateway authorises or captures payment according to the configured policy; raw card data is not stored by this solution.
- The booking engine sends a validated reservation payload and payment state to the channel manager with a correlation ID.

- The channel manager validates mapping/business rules and writes only permitted guest and reservation information to OPERA through the approved interface.
- OPERA creates/acknowledges the reservation and returns booking reference/status. The confirmation travels back through the channel manager to the booking engine.
- The website shows confirmation only after the acknowledgement; notification delivery uses the approved communication provider where configured.

3.4 Channel Distribution and OTA Reservation Flow

- OPERA / Admin publishes approved availability, rates, restrictions, mapped room types, and permitted guest/profile information to the channel manager in real time or scheduled batches.
- Channel manager validates mappings and sends channel-specific availability, rate, restriction, offer and stop-sell updates to OTAs through authenticated APIs.
- OTAs return delivery outcomes and send new reservation, modification or cancellation events to the channel manager according to their supported API contract.
- Channel manager validates the inbound message, records the raw/normalised event, applies conflict rules and forwards a valid permitted reservation event to OPERA.
- Failed/transient events enter the retry queue; invalid/conflicting events are routed to the exception workflow with a human-readable reason and correlation ID.

3.5 Functional Interpretation of Supplied Flow Charts

Flow Chart	Functional Meaning in this SRS	Testable Outcome
Direct Booking Guest Journey	Website search, room/rate selection, guest details and payment form a single booking workflow. The booking engine sends a validated request to the channel manager; OPERA creates/acknowledges the reservation.	A booking is shown as confirmed only after an OPERA booking reference/status returns through the channel manager.

COMPUMATRIX
TECHNOLOGIES PVT LTD

Booking Engine -> Channel Manager -> OPERA	Payment state and the permitted reservation/guest payload are passed with a correlation ID. The channel manager validates mapping and business rules before OPERA write-back.	Invalid payment, mapping or interface outcome never produces a false confirmation or a duplicate OPERA booking.
OPERA <-> Channel Manager	OPERA supplies sellable data: availability, rates, restrictions and mapped room context. Channel manager distributes it and writes only approved reservation data back.	Core OPERA room/rate/inventory/policy data is not created or changed by channel-manager screens.
Channel Manager -> OTA	Approved mapped rates, inventory, restrictions, offers and stop-sell messages are sent to each connected OTA. Reservation lifecycle messages are received back.	Every outbound/inbound message is logged with source, target, correlation ID and result; failures follow retry or exception rules.
Booking Modification / Cancellation	A website guest submits a request; reservations staff review and complete any permitted change in OPERA. The channel manager must not silently overwrite an existing OPERA reservation.	The request is tracked with its original OPERA reference, assigned to staff and resolved with an auditable status.

4. Website Functional Requirements

The public website is responsive and must preserve equivalent booking capability on desktop and mobile browsers. The Figma design adds visible navigation and content routes that are captured below; each page is managed through configured CMS / Admin functions where identified.

4.1 Site-wide Navigation and Interaction Requirements

- The global WESS menu must expose the approved routes: Hospitality, Destinations, Restaurants, Wess Cares, Business Expansion, About Us, Careers, Shop and Contact, plus a persistent Book Now CTA.
- Desktop navigation, mobile menu, footer navigation and in-page CTAs must route only to published pages and must visibly identify the active/expanded state where applicable.
- The menu must be keyboard operable, preserve visible focus, support an Escape/close action for open menus and avoid trapping focus on mobile.
- Book Now must carry property/date/occupancy context when available; switching a content page must not discard an in-progress search unless the visitor deliberately resets it.
- Every content/booking route must define loading, empty, unavailable and recoverable-error states; a static Figma screen is not sufficient evidence of a successful data response.

4.1.1 Wess Homepage

Page Purpose:

Introduce the WESS Hotels brand and direct visitors to hospitality, destinations, restaurants, social-impact and direct-booking journeys.

COMPUMATRIX
TECHNOLOGIES PVT LTD

Functional layout:

Hero and Booking Entry

- Approved full-width brand/experience visual, concise value proposition, primary Book Now CTA and booking-search entry consistent with the layout.
- Search captures destination/property, dates, rooms, adults/children and CTA to availability results.

Discovery Modules

- Featured hospitality properties, destinations, restaurants, Wess Cares, business-expansion, careers and shop editorial/CTA modules according to approved CMS configuration.
- Links route to selected published pages; optional signed-in guest greeting must not expose personal information on shared devices.

Trust and Support

- Approved awards/testimonials, contact route, WhatsApp/call entry and footer legal links.

Functional requirements:

- The booking search must validate check-in/check-out order, occupancy values and mandatory selection before requesting availability.
- Featured content must be CMS-selectable, publishable/unpublishable and ordered without code deployment.
- The page must surface a clear failure/retry state when live availability cannot be retrieved.

- All booking CTAs must preserve entered search context when routing to availability results.

4.1.2 Hospitality / Hotel Listing

Page Purpose:

Let guests browse the Hospitality collection and enter a selected property journey.

Functional layout:

Filters and Listing

- Property cards with image, name, destination, concise summary, key amenities and CTA.
- Destination and amenity filters; optional date/guest summary retained from booking search.

Empty and Loading States

- Clear no-property / no-match message with filter-reset action and support route.

Functional requirements:

- Only published, guest-visible properties may appear in public listings.
- Property filter selection must update results accessibly and show the selected criteria.
- Selecting a property must route to its published detail page and preserve booking-search context where present.

4.1.3 Hotel / Property Detail (including Les Salines)

Page Purpose:

Present a specific hotel's accommodation, facilities, location and booking opportunity.

Functional layout:

Property presentation

- Gallery, property story, location, check-in/out information, amenities, facilities, dining/experience previews and approved policies.
- Accessible media captions/alt text and links to related facility/restaurant/experience pages.

Booking panel

- Contextual booking search with property preselected and date/occupancy fields.

Functional requirements:

- The page must show only the selected property's published content and current approved contact/location data.
- The book-now action must carry the property identifier into availability search.
- A removed/unpublished property URL must not disclose restricted content and must use the configured unavailable-page behaviour.

4.1.4 Availability Search Results

Page Purpose:

Return eligible room/rate availability for a valid stay request.

Functional layout:

Search summary

- Editable property, dates and guest counts with clear price currency, tax/fee disclosure policy and loading state.

Eligible results

- Room/rate result cards show room name, occupancy, inclusions, cancellation summary, inventory status and select CTA.
- Sold-out/limited-availability states and alternative date/property suggestions where configured.

Functional requirements:

- The system must request availability using the selected property, stay dates, occupancy and mapped channel context.
- Only currently eligible, mapped room/rate combinations may be offered for selection.
- Expired, invalid or stale search context must be revalidated before a booking can continue.
- The page must show a recoverable error, without misleading price/availability, if the availability service is unavailable.

4.1.5 Room and Rate Selection

Page Purpose:

Allow the guest to select a specific eligible accommodation and rate plan.

Functional layout:

Room decision

- Room images, bed/occupancy, amenities, description, remaining availability statement were permitted and terms summary.

Rate decision

- Eligible rate-plan cards display price basis, meal plan, inclusions, cancellation/payment conditions and select action.

Price summary

- Stay dates, quantity, nightly/total price presentation and clear taxes/fees treatment according to configured policy.

Functional requirements:

- The selected room/rate must be revalidated against current availability before guest details/payment are accepted.
- A rate plan must not be shown when its mapped property, room, stay, occupancy or restriction condition is not eligible.
- Terms presented to the guest must be associated with the selected rate/policy version and retained with the booking request.

4.1.6 Booking Confirmation

Page Purpose:

Let guests authenticate or continue as allowed by the property's booking policy.

Functional layout:

Access options

- Sign in, create account, reset password and guest checkout where enabled.
- Do not block a permitted guest-checkout booking merely because account creation is declined.

Privacy and recovery

- Clear password rules, verification/recovery messages and consent references.

Functional requirements:

- Authentication must use secure password handling and generic error messages that do not reveal whether an email address exists.
- Account registration must validate contact information and capture required privacy/terms acknowledgement.
- A signed-in user must be able to securely sign out from every public account entry point.

4.1.7 Guest Details and Booking Review

Page Purpose:

Collect the permitted guest/reservation information and show the final pre-payment review.

Functional layout:

Lead guest form

- Lead guest name, email, mobile number, country/residence as required, arrival estimate where configured and special request field.

Guest and stay review

- Selected property, room, rate, guests, dates, policy/terms links, amount and payment requirement.

Consent and submission

- Required acceptance of booking/cancellation terms and privacy notice before payment continuation.

Functional requirements:

- The system must validate mandatory guest/contact fields client-side and server-side before forwarding a booking request.
- Special requests must be presented as requests, not guarantees, and may be passed to OPERA only in an approved permitted field.
- The review state must contain the current booking total and relevant policy before payment authorisation begins.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Guest / User Name	Required; 2-100 characters.
Email	Required; used for confirmation and validated as email format.
Mobile Number	Required where configured; accept international format.
Guest Count	Derived from search; must remain consistent with selected occupancy.
Special Request	Optional; maximum 1,000 characters; no guarantee statement.
Terms and Privacy Acknowledgement	Required checkboxes; store policy/version and timestamp.

4.1.8 Payment

Page Purpose:

Securely obtain payment authorisation/capture before reservation submission when the selected policy requires payment.

Functional layout:

Hosted payment hand-off

- Gateway-hosted/tokenised payment control, visible order total/currency and return/cancel path.
- Accepted payment methods derive from configured gateway/property settings.

Outcome states

- Processing, authorised/captured, declined, cancelled and technical-error states with retry/alternative method action.

Functional requirements:

- The website must not store raw card PAN, CVV or equivalent sensitive payment data.
- Payment outcome must be bound to the booking correlation ID and must be verified server-side before reservation write-back.
- A declined or cancelled payment must not be represented as a confirmed booking.
- Duplicate payment/reservation submission must be prevented through idempotency controls.

4.1.9 Booking Confirmation

Page Purpose:

Show only an OPERA-acknowledged booking confirmation and its next steps.

Functional layout:

Confirmation summary

- OPERA booking reference, confirmation status, selected property/room/rate, stay dates, guest summary, amount/payment state and policy links.

Next steps

- Email/SMS/notification statement where configured, directions/contact route and link to My Bookings if account access exists.

Functional requirements:

- Confirmation must be displayed only after the channel manager receives a valid OPERA acknowledgement/reference.
- If OPERA acknowledgement is pending or fails, the user must receive an honest pending/error status and support reference; no false confirmation.
- The booking reference and correlation ID must be retrievable by authorised support users for investigation.
- Confirmation notifications must use the approved communication configuration and failure to deliver must not change the reservation status.

4.1.10 My Booking and Change / Cancellation Request

Page Purpose:

Let a guest review available booking information and submit a service request for reservation change/cancellation.

Functional layout:

Booking list/detail

- Upcoming/past booking cards with OPERA reference, property, dates, status and support contact.

Service request

- Change/cancellation request form captures requested action, reason, alternate dates/details and contact preference.

Functional requirements:

- A guest must be authenticated or otherwise securely verified before viewing reservation information.
- Submitting a change/cancellation request must create a case for reservations-team review and must not directly override an existing OPERA reservation.
- The page must state that final change/cancellation is subject to applicable policy and OPERA/reservations-team confirmation.
- Authorised staff must see request source, linked booking reference, timestamps and resolution status in the administration portal.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Booking Reference	System-selected/verified; immutable on request.
Request Type	Required: change stay, cancel booking, or assistance.
Requested details	Required; 10-1,000 characters.
Reason	Optional configurable selection/free text.
Contact Preference	Required selection: email, phone or WhatsApp where enabled.

4.1.11 Offers and Promotions

Page Purpose:

Show guest-visible offers and route eligible guests into booking.

Functional layout:

Offer catalogue

- Offer cards with title, image, eligible property/date window, summary, terms and book-now action.

Offer detail

- Full terms, eligibility and booking CTA that passes applicable promotional context.

Functional requirements:

- Only published offers active within configured display dates may appear publicly.
- An offer CTA must not guarantee price/availability; eligibility is validated during availability/rate selection.
- Expired/unpublished offers must not remain accessible as bookable public content.

4.1.12 Destinations

Page Purpose:

Inspire travel and connect destination content to related properties and experiences.

Functional layout:

Destination discovery

- Destination cards/list with image, summary, related hotels and CTA.

Destination detail

- Approved narrative, attractions/experiences, map/contact information and related property booking links.

Functional requirements:

- Destination content must be managed as a publishable CMS record with image, title, summary, detail content and related links.
- Related property links must resolve only to published guest-visible properties.

4.1.13 Restaurants, Facilities and Experience

Page Purpose:

Describe on-property dining, wellness, events, meeting and activity options.

Functional layout:

Category discovery

- Restaurant, spa, gym, meeting room, facility and activity cards filtered by property/category.

Detail content

- Description, images, operating information, capacity/amenities where relevant and enquiry/reservation CTA when supplied.

Functional requirements:

- Each item must support property association, category, description, images, visibility and display order.
- A third-party/out-of-scope facility reservation service must open only an approved hand-off; it must not be represented as a confirmed hotel booking.
- Facilities unavailable at a property must not be automatically shown as available.

4.1.14 About / Brand / Sustainability

Page Purpose:

Publish approved corporate story, values and brand information.

Functional layout:

Brand content

- Story, values, group/company information, sustainability or CSR content, leadership/awards as approved.

Navigation

- Related destination/property/contact routes and global footer.

Functional requirements:

- Content blocks, images and publish status must be editable by authorised CMS users.
- The page must not publish internal operational/financial information unless approved for public release.

4.1.15 Contact and Enquiry

Page Purpose:

Give visitors approved contact options and collect tracked enquiries.

Functional layout:

Contact details

- Property/group contact details, phone/email, map/link, social links and emergency/after-hours disclaimer where supplied.

Enquiry form

- Name, contact, subject/property context, message, consent and confirmation state.

Functional requirements:

- Contact forms must store a timestamped enquiry record accessible to authorised staff.
- The originating page/property context must be retained where available.
- The form must show field-specific validation and a non-sensitive recoverable failure message.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Full Name	Required; 2-100 characters.
Email	Required; standard email validation.
Phone	Optional unless configured as mandatory; international format accepted.
Property / Enquiry Type	Required when presented; prefill allowed from source page.
Message	Required; 10-2,000 characters.
Consent	Required acknowledgement to respond and process the enquiry.

4.1.16 Privacy Policy

Page Purpose:

Publish the client-approved privacy notice and support informed consent.

Functional layout:

Legal content

- Title, effective date and approved legal content.

Navigation

- Persistent footer route and references from booking/account/enquiry consent.

Functional requirements:

- The page must display only approved legal text and effective date.
- Consent references must link to the current published privacy notice.

4.1.17 Terms, Booking and Cancellation Policy

Page Purpose:

Make approved commercial and booking terms available before reservation commitment.

Functional layout:

Policy presentation

- Terms, cancellation/refund policy, booking conditions and property/rate-specific links where applicable.

Functional requirements:

- The page must display current approved legal/policy text.
- The booking journey must link the applicable policy before the guest accepts it.
- The booking record must retain the policy/version acknowledged by the guest.

4.1.18 WhatsApp / Support Hand-off

Page Purpose:

Provide a clear digital hand-off to the approved chat/support destination.

Functional layout:

Entry point

- Fixed/floating or contextual WhatsApp/support CTA with configured label and optional prefilled context.

Expectation

- Inform users that chat is a support hand-off, not an automatic confirmation of a booking or request.

Functional requirements:

- Selecting the entry point must open the approved URL/app/session safely on supported devices.
- Configured phone number, prefilled text and visibility must be administratively controllable.
- No message-received or booking-confirmed claim may be made until the external service and OPERA confirmation are received.

4.1.19 404 / Unavailable Page

Page Purpose:

Recover users from invalid or unpublished public URLs.

Functional layout:

Recovery

- Plain-language unavailable-page message, Home/Property/Contact routes and global navigation.

Functional requirements:

- Unknown public URLs must return the configured custom unavailable-page experience.
- The page must not reveal stack traces, server paths, internal IDs or administration details.

4.1.20 Wess Cares

Page Purpose:

Present WESS Hotels social-impact, sustainability and community initiatives shown in the design.

Functional layout:

Impact story

- Approved Wess Cares introduction, campaigns/initiatives, outcomes, galleries and related property/destination references.
- CMS-managed editorial blocks support approved images, captions, links and display order.

Engagement routes

- Optional read-more, partner/contact or campaign enquiry CTA; no donation, volunteer or personal-data workflow is implied unless explicitly configured.

Functional requirements:

- Only published Wess Cares initiatives may appear; each item must support title, summary, detail content, media, status and display order.
- Images must include meaningful alternative text/caption and must not make unsubstantiated impact claims.
- Any partner or contact CTA must retain originating Wess Cares context in the resulting enquiry.
- A campaign closed or removed by an editor must not retain an active public CTA.

4.1.21 Business Expansion

Page Purpose:

Capture business-development interest for management contracts, partnerships, investment or other approved expansion opportunities.

Functional layout:

Value proposition

- Approved expansion narrative, target geography/asset profile, partnership propositions, proof points and contact CTA consistent.

Expansion enquiry

- Validated organisation/contact form with opportunity type, location/asset context, message and consent; confirmation does not create a commercial agreement.

Functional requirements:

- The page must clearly distinguish an expression of interest from a binding commercial proposal, contract or investment commitment.
- A valid submission must create a timestamped business-expansion enquiry visible only to authorised business-development users.
- The source page, selected opportunity type and any property/destination context must be stored with the enquiry.
- The form must use server-side validation, abuse protection and a non-sensitive recoverable error state.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Full Name	Required; 2-100 characters.
Business Email	Required; standard email validation.
Organisation	Required; 2-150 characters.
Opportunity Type	Required configurable selection, such as management, partnership, investment or other.
Location / Asset Details	Optional; 2-500 characters when supplied.
Message	Required; 20-2,000 characters.
Consent	Required acknowledgement permitting a business-development follow-up.

4.1.22 Careers Listing

Page Purpose:

List current WESS Hotels opportunities in the Careers route.

Functional layout:

Vacancy discovery

- Published vacancy cards/list rows with title, location, department/property, employment type, posting date and View/Apply CTA.
- Optional filter/search by location, department or employment type and accessible no-open-roles state.

Functional requirements:

- Only vacancies marked open and published may appear in the public listing or filter/search result.

- Each vacancy CTA must open the selected career detail/application page and preserve the vacancy reference.
- Closed or unpublished vacancies must not accept new applications and must not expose public job-detail content.
- The CMS must support vacancy title, location, department, description, status, publish date and display/order controls.

4.1.23 Career Detail and Application

Page Purpose:

Show a selected vacancy and collect a protected candidate application.

Functional layout:

Job detail

- Title, department/property, location, employment type, responsibilities, requirements, approved benefits/summary and Apply CTA.

Application

- Validated applicant form, CV upload, privacy acknowledgement and on-screen confirmation after accepted submission.

Functional requirements:

- The vacancy context must be fixed to the selected open role and stored with each submitted application.
- The system must accept only configured safe CV types such as PDF, DOC and DOCX, enforce a configurable file-size limit and scan/store files outside public web access.

- A successful application must create a timestamped record with status; authorised users may access the CV only through protected administration controls.
- A closed, deleted or unpublished vacancy URL must not expose an active application form.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Selected Vacancy	Read-only context/system reference; required.
Full Name	Required; 2-100 characters.
Email Address	Required; standard email validation.
Phone Number	Required; international format accepted.
Current Location	Optional; 2-150 characters when entered.
Cover Note	Optional; maximum 2,000 characters.
CV Upload	Required; configured safe file types and size limit.
Privacy Consent	Required acknowledgement for recruitment-data processing.

4.1.24 Shop Catalogue and Product Detail

Page Purpose:

Present the Shop catalogue separately from hotel-reservation content.

Functional layout:

Catalogue

- Published product cards with image, name, short description, price/currency, availability state, category/filter and View/Add-to-Basket CTA.

Product detail

- Image gallery, full description, variant/quantity controls where supplied, price, availability, delivery/return summary and Add-to-Basket CTA.

Functional requirements:

- Only published products with an active sellable status may be displayed or added to basket.
- Product price, currency, availability and selected variant must be revalidated server-side when adding to basket and before order payment.
- A hotel reservation, OPERA room inventory and shop product inventory must remain separate data domains.
- If commerce fulfilment/inventory integration is unavailable, the page must show an approved unavailable/pre-order/enquiry state rather than accepting an unfulfillable order.

4.1.25 Shop Basket and Order Checkout

Page Purpose:

Let a shopper review item and submit a non-reservation product order through an approved commerce payment flow.

Functional layout:

Basket

- Line items, variant, quantity, item price, subtotal, delivery/tax estimate where configured, remove/update controls and Continue to Checkout CTA.

COMPUMATRIX
TECHNOLOGIES PVT LTD

Checkout and confirmation

- Contact/delivery details, order summary, delivery/return terms, hosted/tokenised payment hand-off, pending/success/failure states and order reference after successful payment/order acknowledgement.

Functional requirements:

- Basket updates must revalidate product availability and price before checkout; unavailable items must be clearly identified and cannot be silently ordered.
- Shop checkout must use a separately correlated commerce order ID and must not create an OPERA hotel reservation.
- The payment integration must not store raw card data; a declined/cancelled payment must not create a paid order.
- Order confirmation must be shown only after the commerce service records the order/payment outcome and returns an order reference.
- Delivery address, taxes, fulfilment status, refunds and returns must be managed by the agreed commerce/fulfilment process, not OPERA unless separately integrated.

Form / Data Specification:

Field / Control	Rules and System Behaviour
Basket Items	System-derived; each item/variant/quantity must pass availability validation.
Customer Name	Required; 2-100 characters.
Email Address	Required; standard email validation.
Phone Number	Required; international format accepted.
Delivery Address	Required; validate required locality/country/postal fields.
Delivery Method	Required when more than one approved option is available.
Terms Acknowledgement	Required acceptance of approved return/terms policy.
Payment	Gateway-hosted/tokenised control; no raw card data stored by this solution.

5. Super Admin Portal Functional Requirement

The administration portal is role-protected. Operational records that belong to OPERA must be presented as synchronised/read-only or as authorised integration actions; it must not become an alternative uncontrolled PMS.

5.1 Super Admin Dashboard

Page Purpose:

Show role-appropriate operational and commercial summary cards.

Functional layout:

Screen functions

- Property/organisation switcher, pending reservations/service requests, channel health, payment/refund indicators, occupancy/revenue report links and alert feed.

Functional requirements:

- Dashboard cards must be filtered by role/property entitlement.
- Counts must link to the underlying filtered records and show last-refresh time for synchronised data.
- Dashboard must not imply OPERA-derived data is real-time when the latest sync timestamp is older.

5.2 Organisation, Chain and Property Management

Page Purpose:

Configure the multi-property hierarchy and guest-visible property settings.

Functional layout:

Screen functions

- Organisation/chain records, property profile, address/contact/time zone/currency, display status, approved identifiers and integration association.

Functional requirements:

- Only super administrators may create/disable organisation or property records.
- Integration identifiers must be validated and changes audited before they are used by synchronisation.
- Disabling a property must prevent new public sale only after a confirmed operational impact review.

5.3 Room, Inventory and Allocation View

Page Purpose:

Review synchronised room categories, inventory/allocation and room status context.

Functional layout:

Screen functions

- Room category list, inventory calendar, allocation summary, amenity/upgrade reference and data freshness status.

Functional requirements:

- Core room/inventory fields from OPERA must be identified as OPERA-managed/read-only in this portal.
- Any approved channel allocation/stop-sell action must be clearly separated from OPERA master inventory and logged.
- The screen must show sync source/time and link to relevant channel delivery status.

5.4 Rate, Rate Plan and Tax View

Page Purpose:

Review synchronised commercial records and approved channel overlays.

Functional layout:

Screen functions

- Base-rate/rate-plan list, meal plans, packages, extra services, taxes/fees, channel-rate overlays and dynamic rule references.

Functional requirements:

- OPERA base rates/rate plans/taxes must be labelled as system-of-record data and not freely editable here.
- Channel-specific offer/discount overlays must retain effective dates, channel scope, approver and audit trail.

- Rate/restriction changes must not be sent to a channel until mapping validation succeeds.

5.5 Reservation and Booking Calendar

Page Purpose:

Search and review reservations/booking events by property, source and stay date.

Functional layout:

Screen functions

- Calendar/list views, booking reference, source, arrival/departure, status, payment indicator, exception marker and OPERA link/reference.

Functional requirements:

- Confirmed reservation data displayed from OPERA must be read-only unless the user opens the approved OPERA operational workflow.
- Direct/OTA booking source and channel correlation ID must be visible to authorised users.
- Modification/cancellation service requests must be queued for reservations-team action with status history.

5.6 Guest, Enquiry and Service Request Management

Page Purpose:

Review guest-contact context, website enquiries and request follow-up without replacing OPERA guest history.

Functional layout:

Screen functions

- Enquiry list, guest contact shown within permission scope, preference/request detail, linked booking, assignment, status and communication notes.

Functional requirements:

- Personal data visibility must be constrained by role and business need.
- Portal notes must be auditable and must not silently update OPERA guest master/history.
- Users must be able to assign, status and resolve website service requests.

5.7 Payments, Refunds and Invoices

Page Purpose:

Review payment transaction history and route permitted finance actions.

Functional layout:

Screen functions

- Payment references/status, gateway transaction reference, refund request/status, invoice record/link and reconciliation flags.

Functional requirements:

- No raw card data may be displayed, stored or exported.
- Refund actions must require a role-approved workflow and must record actor, reason, amount and external outcome.
- Invoice/financial posting remains subject to OPERA/finance-system authority.

5.8 Promotions, Offers and Campaigns

Page Purpose:

Create/manage guest-facing commercial campaigns within approved commercial guardrails.

Functional layout:

Screen functions

- Promo codes, offers, coupons, discount rules, date windows, properties/channels, content and publish state.

Functional requirements:

- A promotion must have a unique code/name, validity window, scope, eligibility and status before publication.
- Promotion eligibility must be validated during booking; a CMS card alone cannot override rate/inventory rules.
- Expired promotion must automatically stop public presentation and channel distribution where configured.

5.9 Website CMS

Page Purpose:

Manage public-page content and media.

Functional layout:

Screen functions

- WESS Homepage, Hospitality/property content, Destinations, Restaurants, Wess Cares, Business Expansion, About Us, Careers, Shop, Contact, offers and reusable media.

Functional requirements:

- Authorised users must add/edit/publish/unpublish/archive content according to role.
- Media must require allowed type/size and descriptive alt text/caption where applicable.
- Deleting/archiving content must not leave public broken links; confirmation is required.
- Published content changes must retain editor/timestamp audit data.
- Business Expansion, Wess Cares and Shop content must retain their separate routing and must not be published as hotel-booking inventory or OPERA-managed data.

5.10 Restaurant, Facility and Active Management

Page Purpose:

Manage property-associated facility information shown on the website.

Functional layout:

Screen functions

- Restaurants, spa, gym, meeting rooms, facilities and activities with content, imagery, hours/capacity, property association and visibility.

Functional requirements:

- Facility records must support property/category mapping and guest-visible publish control.
- Availability or reservation information supplied by an external facility system must identify its source and refresh state.

5.11 Operations Reference View

Page Purpose:

Expose permitted operational overview and hand-offs for check-in/out, housekeeping, maintenance and inspection.

Functional layout:

Screen functions

- Read-only operation queues/status where an OPERA-approved feed exists; links or hand-off instructions to OPERA operational screens.

Functional requirements:

- Operational source-of-truth fields must identify OPERA as owner.

- This delivery does not create an alternative check-in/out or housekeeping system unless a separately approved OPERA interface is provided.

5.12 Reports and Analytics

Page Purpose:

Provide authorised reporting across booking, revenue, occupancy, channels, guests, payments, cancellations, refunds, inventory/rates, website and audit activity.

Functional layout:

Screen functions

- Date/property/source filters, scheduled/export controls where approved, data freshness/definition label and access-controlled downloads.

Functional requirements:

- Reports must clearly state source, generation time, time zone and applied filters.
- OPERA-derived reports must use reconciled or labelled synchronised data; no dashboard may misrepresent stale data as final finance truth.
- Export must respect role permissions and protect personal/payment data.

5.13 Users, Roles, Permissions and Audit

Page Purpose:

Administer staff access and governance.

Functional layout:

Screen functions

- User list, role/permission matrix, department assignment, active/locked state, activity/audit logs and session/security controls.

Functional requirements:

- Access must be least-privilege and scoped by role, organisation/property and department where configured.
- Role/permission and high-risk configuration changes must be audited with before/after values where technically feasible.
- Disabled users must lose access promptly; shared accounts are prohibited.

5.14 System Configuration

Page Purpose:

Manage controlled general settings, booking rules, cancellation policies, tax configuration references, notification settings and system logs.

Functional layout:

Screen functions

Configuration categories, effective dates, change approval indicator, test/production environment label and system-log view.

Functional requirements:

- Configuration changes affecting booking, price, channel distribution or OPERA mapping must require elevated permission and audit recording.
- A configuration screen must not allow direct ungoverned modification of OPERA master data.
- System logs must be searchable by date, severity, service and correlation ID.

5.15 Careers and Shop Operations

Page Purpose:

Manage careers/applications and shop catalogue/order operations without mixing them with OPERA reservation data.

Functional layout:

Screen functions

- Vacancy records, applications, protected CV downloads, product catalogue, product availability, order list, fulfilment/refund status and role-scoped exports.

Functional requirements:

- Career applications and uploaded CVs must be accessible only to authorised recruitment users and must retain status/audit history.
- Shop product, order and fulfilment records must use an approved commerce data source and must remain separate from OPERA reservations and hotel inventory.
- Shop refunds/fulfilment actions must require authorised workflow and record actor, reason, amount/status and external service outcome.
- If shop commerce is deferred, the administrator must be able to disable purchase CTAs and publish an approved enquiry/unavailable state.

6. Channel Manager Functional Requirement

The channel manager is the integration and distribution control plane. Its pages provide controlled configuration, monitoring and exception management; operational core-data changes remain in OPERA.

6.1 Channel Manager Dashboard

Page Purpose

Show channel connectivity, sync health, alerts and recent reservation activity.

Functional layout:

Screen functions

- Channel status cards, failed/queued message counts, last successful sync, new booking feed, alert severity and drill-down links.

Functional requirements:

- Dashboard health must be based on actual connector/message outcomes and show last-refresh timestamps.
- Critical failure alerts must link to the affected connector/message/mapping context.

6.2 OTA Connection and Credential Management

Page Purpose:

Configure approved OTA/channel connector settings.

Functional layout:

Screen functions

- Channel catalogue, connection status, endpoint/environment, credential secret reference, property scope, time zone/currency and test/production state.

Functional requirements:

- Secrets must be encrypted/secret-managed, masked in UI/logs and accessible only to authorised roles.
- Connection testing must use the configured environment and log a non-sensitive result.
- Disabling a connector must require confirmation and raise an operational impact warning.

6.3 Channel Mapping Management

Page Purpose:

Map OPERA properties, room types, rate plans and meal plans to each OTA representation.

Functional layout:

Screen functions

- Property mapping, room mapping, rate-plan/meal-plan mapping, mapping status, effective date and validation result.

Functional requirements:

- A channel update/reservation must not be processed when required active mapping is missing or ambiguous.
- Mapping changes must be versioned/audited and should support controlled effective timing.
- Mapping validation must identify duplicate, inactive or incompatible identifiers before activation.

6.4 Channel Inventory and Allocation Calendar

Page Purpose:

Review/publish channel sellable availability and allocation controls.

Functional layout:

Screen functions

- Date-grid by property/room/channel, OPERA source availability, channel allocation, stop-sell/reopen status and delivery outcome.

Functional requirements:

- OPERA-provided availability is the upstream source; the channel manager must preserve source timestamp and mapping context.
- Any channel allocation or stop-sell override must be explicitly scoped, approved and logged without overwriting OPERA master inventory.
- Inventory publication must be idempotent and must capture OTA response/acknowledgement.

6.5 Channel Rates, Offers and Restrictions

Page Purpose:

Distribute approved channel pricing and restrictions.

Functional layout:

Screen functions

- Channel-rate view, promotional overlay, min/max stay, CTA, CTD, stop-sell, date/room scope, validation and publish status.

Functional requirements:

- Base rate/rate-plan inputs originate in OPERA; channel-specific offers/markups/discounts must not mutate OPERA base rate values.
- Restrictions must be mapped to each channel's supported capability; unsupported restrictions must be flagged, not silently dropped.
- The system must retain exact request/response outcome for every distribution attempt.

6.6 Inbound Reservation Synchronisation

Page Purpose:

Receive OTA/direct booking events, validate them and write permitted data to OPERA.

Functional layout:

Screen functions

- Reservation event list, raw/normalised payload access for authorised support, mapping/validation result, OPERA write-back status and confirmation reference.

Functional requirements:

- New reservation, modification and cancellation events must be processed according to the channel's approved supported contract.
- Inbound reservation processing must use idempotency keys/correlation logic to prevent duplicate OPERA reservations.
- Only permitted guest/reservation fields may be written to OPERA, using the approved target tables/services.
- Existing OPERA reservations must not be silently overwritten; modification/cancellation rules must respect the approved OPERA interface and manual-review boundary.

6.7 Synchronisation and Communication Logs

Page Purpose:

Provide searchable evidence for data distribution and inbound integration calls.

Functional layout:

Screen functions

- Sync type/time, property/channel, entity reference, request/response summary, status, error code, duration, correlation ID and actor/job.

Functional requirements:

- Logs must differentiate inventory/rate/restriction/reservation/credential/system events.
- Sensitive credentials and raw card data must be excluded/masked from all logs.
- Authorised users must filter and export logs within retention/security policy.

6.8 Retry Queue and Conflict Resolution

Page Purpose:

Safely resolve transient failures, validation conflicts and overbooking exceptions.

Functional layout:

Screen functions

- Queued events, retry count/backoff, error cause, related reservation, recommended action, operator assignment and resolution history.

Functional requirements:

- Transient API failures may retry using configurable exponential backoff and maximum attempt limits.
- Invalid mapping/business data must not endlessly retry; it must enter an actionable exception state.
- Overbooking handling must follow a configured approved action such as manual review, tentative hold, mark-overbook or reject where the channel/OPERA contract supports it.
- Manual retry/override actions must require permission and record user, reason and result.

6.9 Automation Rule Engine

Page Purpose:

Configure controlled event-based pricing, stop-sell/reopen and routing rules.

Functional layout:

Screen functions

- Rule condition/action builder, property/channel scope, effective window, simulation/validation, approval state and execution history.

Functional requirements:

- Rules must be deterministic, scoped and versioned; conflicting rule precedence must be defined.
- Rules must not alter OPERA master records unless an explicitly approved OPERA interface/action is available.
- Before activation, a rule must show target channels, conditions, expected action and approver.
- Every rule execution must generate an auditable outcome record.

6.10 Reconciliation and Monitoring

Page Purpose:

Compare expected/observed channel data and support remediation.

Functional layout:

Screen functions

- Booking, inventory and rate reconciliation views; mismatch category, source snapshot/time, recommended action, acknowledgement and resolution.

Functional requirements:

- Reconciliation must compare mapped entities and timestamps; it must not treat unrelated room/rate records as a match.
- Auto-correction, when enabled, must be restricted to safe approved publish actions and must be logged.
- Unresolved mismatches must remain visible until acknowledged/resolved by an authorised operator.

7. Opera and External Interface Requirements

7.1 Opera Interface Contract

Direction	Permitted Payload / Behaviour	Control
OPERA -> Channel Manager	Availability, rates/rate plans, restrictions, room-type context, permitted guest profile context and schedule/real-time updates.	OPERA remains source; channel manager validates mapping and logs receipt.
Channel Manager -> OPERA	New reservation and approved permitted guest/reservation write-back, plus acknowledgement correlation where supported.	Only approved fields/services; no master-data mutation; idempotent writes.
Channel Manager <-> OTA	Authenticated channel updates (rates/inventory/restrictions/offers/stop sell) and reservation lifecycle messages.	Connector-specific mapping, capability validation, response logging and retry/conflict workflow.
Website/App -> Booking Engine	Search, selection, guest details, policy acknowledgement and payment state.	Server-side validation, correlation ID and no raw-card storage.
Booking Engine -> Channel Manager	Validated direct booking reservation request and payment result/state.	Requires current availability/rate validation and idempotency key.

7.2 Interface Controls

- Every integration message must have a correlation ID and store source, destination, timestamp, entity type, outcome and safe error code.
- API credentials, client secrets and tokens must be stored in a secure secret-management approach and never exposed to client applications or logs.

- Inbound webhooks/API calls must validate authentication/signature or equivalent approved control before processing.
- Outbound messages must be idempotent where the target supports it; retry must not create duplicate reservations or duplicate inventory/rate effects.
- Interface timeout, maintenance and validation failures must produce a recoverable business status and monitoring alert according to severity.
- Final OPERA field mapping, permissible write-back fields, service endpoints and error handling must be agreed during integration design against the hotel's licensed OPERA version/interface documentation.

7.3 Payment and Communication Services

- Payment gateway integration must use a provider-approved hosted/tokenised pattern and return an authoritative transaction reference/status to the backend.
- Email, SMS, push and WhatsApp services are notification/support channels. Their delivery result does not by itself change a reservation status.
- Map, analytics and app-store services, if selected, must use client-approved accounts/keys and conform to their terms of service.

8. Data, Security and Non-functional Requirements

- The public website must be responsive and usable on agreed current desktop and mobile browser versions.
- All public, admin and integration traffic must use HTTPS/TLS; insecure endpoints must not be used in production.
- Inputs must be validated server-side as well as client-side; responses must not expose stack traces, secrets or sensitive internal data.
- Role-based access control must protect administration/channel-manager functions, with least privilege and property/organisation scope.
- Sensitive personal data, bookings and documents must be access-controlled; raw card data must never be stored by the solution.
- System, audit and sync logs must support investigation by time, user/service, correlation ID and outcome, while masking secrets and payment data.
- The solution must support configurable retention, deletion/anonymisation and export processes in line with client policy and applicable privacy obligations.
- Accessibility must use semantic structure, keyboard support, visible focus, sufficient contrast, text alternatives and understandable form errors aligned to practical WCAG 2.1 AA-oriented implementation.
- Availability/rate and reservation flows must expose loading, timeout, empty and retry states; cached/stale data must be labelled where shown.
- Integrations must provide monitoring/alerting for connector outage, repeated failures, delayed queues and reconciliation mismatches.
- Backups, recovery objectives, deployment environments and incident escalation targets must be agreed before production go-live.
- The product must support a documented UAT period with traceable defects, acceptance decisions and production-readiness checklist.

9. Acceptance Criteria

Scenario	Acceptance Outcome	Evidence
Direct Booking	Guest can search, select eligible rate, complete approved payment and see confirmation only after OPERA acknowledgement.	Booking reference, correlation trail and UI confirmation.
Payment Failure	Declined/cancelled payment remains unconfirmed; guest can retry or choose support without duplicate reservation.	Gateway status and no duplicate OPERA booking.
OTA Distribution	Mapped rate/inventory/restriction update is sent to approved test OTA and its response is recorded.	Connector request / response and log correlation.
OTA Reservation	Valid OTA reservation reaches OPERA through channel manager exactly once and returns acknowledgement.	OPERA reference plus idempotency/log evidence.
Bad Mapping / Conflict	Unmapped/invalid event is not written to OPERA; it enters actionable exception workflow.	Exception reason, assignment and audit history.
Change/Cancellation Request	Guest request is captured, linked to booking and routed for manual reservations-team review; original OPERA reservation is not silently changed.	Service request record and OPERA boundary evidence.
Role Security	A user cannot access a property, credential, payment or configuration function outside assigned permissions.	Role test matrix and audit log.
CMS Publishing	Authorised editor can publish / unpublish a property / offer / facility content item; the public website reflects allowed state.	Admin audit and public-browser verification.
Monitoring	Integration failure triggers visible dashboard/alert state and allows authorised operator investigation/retry where safe.	Alert, log and resolution evidence.

10. Technology Stack

- **Frontend:** React.js / Next.js
- **Backend:** Node.js
- **Database:** MongoDB / PostgreSQL
- **Security:** AuthO 2.0 / JWT
